

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (currently amended) An apparatus for automatically routing digital information, comprising:
 - a. an interface coupled to receive downloaded digital information having a type;
 - b. a storage device coupled to the interface to store the digital information and a routing software to compare the type with a set of values that determine where the digital information is to be transmitted; and
 - c. a controller coupled to the storage device to automatically sort and selectively transmit the digital information based on the type to one or more secondary devices coupled to a computing device detected by the routing software.
2. (original) The apparatus as claimed in claim 1 wherein the digital information is downloaded from a server to the storage device.
3. (original) The apparatus as claimed in claim 1 wherein the storage device is a hard disk drive.
4. (original) The apparatus as claimed in claim 1 wherein the storage device is a semiconductor memory.
5. (original) The apparatus as claimed in claim 1 wherein the digital information comprises media content including music, videos, and data.
6. (original) The apparatus as claimed in claim 1 wherein the controller utilizes a routing table to route the digital information.
7. (original) The apparatus as claimed in claim 6 wherein the routing table further comprises a file type column and a device column.

8. (original) The apparatus as claimed in claim 6 wherein the routing table utilizes meta data information within the digital information to route the digital information.
9. (original) The apparatus as claimed in claim 6 wherein the routing table is user-defined.
10. (original) The apparatus as claimed in claim 1 wherein the controller automatically detects one or more secondary devices.
11. (original) The apparatus as claimed in claim 1 wherein the secondary devices include one or more of an mp3 player, a video recorder, and a handheld.
12. (currently amended) An apparatus for automatically routing digital information from a computing device to one or more secondary devices, comprising:
- a. an interface coupled to receive downloaded digital information having a type;
 - b. a storage device coupled to the interface to store the digital information and a routing software to compare the type with a set of values that determine where the digital information is to be transmitted; and
 - c. a controller coupled to the storage device to automatically:
 - i. ~~detect the one or more secondary devices;~~
 - ii. determine which type of digital information is routed to which secondary device; and
 - iii. ii. selectively transmit the digital information based on the type to the one or more secondary devices based on the type coupled to the computing device detected by the routing software.
13. (original) The apparatus as claimed in claim 12 wherein the digital information is downloaded from a server to the storage device.
14. (original) The apparatus as claimed in claim 12 wherein the storage device is a hard disk drive.

15. (previously presented) The apparatus as claimed in claim 12 wherein the storage device is a semiconductor memory.
16. (original) The apparatus as claimed in claim 12 wherein the digital information comprises media content including music, videos, and data.
17. (original) The apparatus as claimed in claim 12 wherein the controller utilizes a routing table to route the digital information.
18. (original) The apparatus as claimed in claim 17 wherein the routing table further comprises a file type column and a device column.
19. (original) The apparatus as claimed in claim 17 wherein the routing table utilizes meta data information within the digital information to route the digital information.
20. (original) The apparatus as claimed in claim 17 wherein the routing table is user-defined.
21. (original) The apparatus as claimed in claim 12 wherein the secondary devices include one or more of an mp3 player, a video recorder, and a handheld.
22. (currently amended) An apparatus for automatically routing digital media content from a computing device to one or more secondary devices comprising:
- a. an interface coupled to receive downloaded digital media content having a type;
 - b. a storage device coupled to the interface to store the digital media content and a routing software to compare the type with a set of values that determine where the digital media content is to be transmitted; and
 - c. a controller coupled to the storage device to automatically:
 - i. ~~detect the one or more secondary devices;~~
 - ii. determine which type of media content is routed to which secondary device utilizing a routing table; and

iii. ~~ii.~~ selectively transmit the digital media content based on the type to the one or more secondary devices ~~based on the type~~ coupled to the computing device detected by the routing software.

23. (original) The apparatus as claimed in claim 22 wherein the digital media content is downloaded from a server to the storage device.

24. (original) The apparatus as claimed in claim 22 wherein the storage device is a hard disk drive.

25. (original) The apparatus as claimed in claim 22 wherein the storage device is a semiconductor memory.

26. (original) The apparatus as claimed in claim 22 wherein the digital media content includes music, videos, and data.

27. (original) The apparatus as claimed in claim 22 wherein the routing table further comprises a file type column and a device column.

28. (original) The apparatus as claimed in claim 22 wherein the routing table utilizes meta data information within the digital information to route the digital information.

29. (original) The apparatus as claimed in claim 22 wherein the routing table is user-defined.

30. (original) The apparatus as claimed in claim 22 wherein the secondary devices include one or more of an mp3 player, a video recorder, and a handheld.

31. (currently amended) A network of devices for automatically routing digital information comprising:

- a. a server including digital information and a routing software to compare a type with a set of values that determine where the digital information is to be transmitted:

- b. a computing device coupled to the server for obtaining and automatically transmitting the digital information based on a the type; and
 - c. one or more secondary devices coupled to the computing device detected by the routing software for receiving the digital information from the computing device.
32. (original) The network of devices as claimed in claim 31 wherein the digital information comprises media content including music, videos, and data.
33. (original) The network of devices as claimed in claim 31 wherein the computing device further comprises:
- a. an interface coupled to receive the digital information having a type;
 - b. a storage device coupled to the interface to store the digital information; and
 - c. a controller coupled to the storage device to automatically sort and distribute the digital information based on the type to one or more secondary devices.
34. (original) The network of devices as claimed in claim 33 wherein the controller automatically detects the one or more secondary devices.
35. (original) The network of devices as claimed in claim 33 wherein the storage device is a hard disk drive.
36. (original) The network of devices as claimed in claim 33 wherein the storage device is a semiconductor memory.
37. (original) The network of devices as claimed in claim 31 wherein the computing device is a personal computer.
38. (original) The network of devices as claimed in claim 31 wherein the computing device is a set-top box.
39. (original) The network of devices as claimed in claim 31 wherein the computer device further comprises a modem device for coupling to the server.

40. (original) The network of devices as claimed in claim 31 wherein the secondary devices comprise an mp3 player, a video recorder, and a handheld device.
41. (currently amended) A method for routing digital information from a computing device to one or more secondary devices based on a routing software that compares a type with a set of values that determine where the digital information is to be transmitted, comprising:
- a. receiving the digital information having a the type;
 - b. automatically sorting the digital information based on the type; and
 - c. automatically transmitting the digital information based on the type to a corresponding one or more of the secondary devices based on the type coupled to the computing device detected by a routing software.
42. (original) The method as claimed in claim 41 further comprising downloading the digital information from a server to the computing device.
43. (original) The method as claimed in claim 41 further comprising automatically detecting the secondary devices.
44. (original) The method as claimed in claim 41 further comprising storing the digital information in the computing device until the corresponding one or more of the secondary devices is coupled to the computing device.
45. (currently amended) A method for routing digital information from a computing device to one or more secondary devices, comprising:
- a. receiving the digital information having a type;
 - b. automatically detecting the secondary devices coupled to the computing device by a routing software that compares the type with a set of values that determine where the digital information is to be transmitted;
 - c. automatically sorting the digital information based on the type; and
 - d. automatically transmitting the digital information to a corresponding one or more of the secondary devices based on the type.

46. (original) The method as claimed in claim 45 further comprising downloading the digital information from a server to the computing device.

47. (original) The method as claimed in claim 45 further comprising storing the digital information in the computing device until the corresponding one or more of the secondary devices is coupled to the computing device.

48. (previously presented) The apparatus as claimed in claim 1 wherein the digital information is stored on the storage device until the one or more secondary devices are available to receive the digital information.

49. (previously presented) The apparatus as claimed in claim 12 wherein the digital information is stored on the storage device until the one or more secondary devices are available to receive the digital information.

50. (previously presented) The apparatus as claimed in claim 22 wherein the digital media content is stored on the storage device until the one or more secondary devices are available to receive the digital media content.

51. (previously presented) The network of devices as claimed in claim 31 wherein the digital information is stored on the computing device until the one or more secondary devices are available to receive the digital information.

52. (currently amended) An apparatus for automatically routing digital information comprising media content of different media types including music, video and data, the apparatus comprising:

- a. an interface coupled to receive downloaded digital information having a media type;
- b. a storage device coupled to the interface to store the digital information and a routing software to compare the media type with a set of values that determine where the digital information is to be transmitted; and

- c. a controller coupled to the storage device to automatically sort and selectively transmit the digital information based on the media type to one or more secondary devices coupled to a computing device detected by the routing software.

53. (currently amended) A method for routing digital information based on a routing software that compares a media type with a set of values that determine where the digital information is to be transmitted, the digital information comprising media content of different media types including music, video and data, from a computing device to one or more secondary devices, comprising:

- a. receiving the digital information having ~~a~~ the media type;
- b. automatically sorting the digital information based on the media type; and
- c. automatically transmitting the digital information based on the media type to a corresponding one or more of the secondary devices ~~based on the media type~~ coupled to the computing device detected by the routing software.

54. (currently amended) An apparatus for automatically routing digital media content of different media types including music, video and data, from a computing device to one or more secondary devices, comprising:

- a. an interface coupled to receive downloaded digital media content having a media type;
- b. a storage device coupled to the interface to store the digital media content and a routing software to compared the media type with a set of values that determine where the digital media content is to be transmitted; and
- c. a controller coupled to the storage device to automatically:
 - i. detect the one or more secondary devices;
 - ii. determine which media type of media content is routed to which secondary device utilizing a routing table, the routing table comprising a media type column and a device column; and
 - iii. ii. selectively transmit the digital media content based on the media type to the one or more secondary devices ~~based on the media type~~ coupled to the computing device detected by the routing software.
